With Medicaid Per Capita Caps, Wisconsin Loses

For the last 50 years, Medicaid has provided vital services to people with disabilities, the elderly, children, families, and pregnant women. Medicaid achieves this goal through an open-ended state-federal funding partnership that guarantees coverage for all who qualify. The American Health Care Act (AHCA) proposes to break this partnership. It would cut hundreds of billions of dollars of federal funding to the states through drastic changes including dismantling Medicaid’s current state-federal financing structure by implementing Medicaid funding caps.

Medicaid caps limit the total amount of federal Medicaid funds states can receive. While some states will experience deeper cuts than others, every state is at risk for major losses, and no state will see an increase in federal funds. Caps will lock in historic spending trends without regard to Wisconsin’s future need or predicted growth. Furthermore, the caps would make it harder for Wisconsin to respond to crises: federal Medicaid funding would no longer increase automatically to share the cost of care after natural disasters, new epidemics, or costly new medical treatments or public health emergencies, like the opioid epidemic or Zika. The cap also wouldn’t have the flexibility to meet demographic changes, such as the rise in seniors’ Medicaid costs as they age, leaving states with even larger cuts over the long run. A federal funding cap cannot appropriately account for the specific spending pressures, needs, and values of Wisconsin.

How Medicaid Caps Will Harm Wisconsin

1. **Cuts to Medicaid will jeopardize Wisconsin’s ability to provide health care to children, seniors, and people with disabilities.** The proposed caps under the AHCA would effectively cut $1 billion of federal funding for Wisconsin over a ten-year period, shifting these costs to the state. Wisconsin would have to raise taxes, cut other parts of its budget, like education, or – more likely -- severely cut Medicaid services, eligibility, and provider payments to make up for this shortfall. The magnitude of this cut would be unprecedented. States have struggled to absorb reductions as small as 2% in Medicaid funding, but the AHCA’s proposed cap could lead to cuts in Medicaid spending as high as 2%.

2. **Caps on Medicaid funding would blow a hole in Wisconsin’s budget.** Wisconsin’s budget relies heavily on federal funding, comprising 44.9% of total federal funds to the state. Federal funding of Medicaid frees up state funding for schools, workforce development, transportation, and public safety.
3. **Medicaid caps would strip Wisconsin’s flexibility to address health care needs that change over time.** Wisconsin spends $3,742 per adult Medicaid enrollee, the 2nd lowest rate in the country. Medicaid caps would turn Wisconsin’s historically low spending into a permanent federal funding ceiling, stripping the state’s flexibility to get increased federal support to address changing health markets, residents’ needs, emerging treatments and technology, public health emergencies and policy choices.

4. **A federal standard growth factor fails to meet the varying and changing needs of states.** The proposed federal caps do not account for state-specific spending growth rates. Caps will create this unfair result any time a state experiences higher growth than the federal standard. Consider, for example, that Wisconsin experienced a faster than the national average growth rate among non-disabled, non-elderly adult Medicaid enrollees. A cap does not recognize varying state growth rates that may be impacted by a growing elderly population (or an increase in average age within that elderly population), greater need for substance abuse treatment, higher medical costs with the invention of new technology or prescription medication, or other drivers of cost.
5. **Priority health initiatives in Wisconsin are at risk if Medicaid funding is capped.**

- Medicaid funding helps support critical early childhood and education services, including home visiting programs, development services that help ensure school readiness, special education services in public schools, school-based health care services, and even school nurses.

- Medicaid funding helps people who need long term care, like seniors and people with disabilities, stay in their homes and communities and out of nursing facilities. Because these home and community-based programs are optional – and are generally the biggest optional programs in states’ Medicaid programs – capping federal Medicaid funding will force states to end these programs, cut services, raise eligibility levels, or impose waiting lists.

- Medicaid funding allows 554,200 women and girls in Wisconsin to obtain the health care they need throughout their lives.iii Women have unique health care needs – they are the primary users of maternity care, family planning, and long-term care services – and nearly half of all women have an ongoing condition requiring regular monitoring, care, or medication. Medicaid is a vital source of long-term care, family planning and maternity care, providing care for nearly half of pregnant women and paying for half of the nation’s long-term services and supports costs.

- Medicaid is the primary source of funding for treatment services for people with mental illness and substance abuse disorders. It provides a consistent source of revenue for behavioral health providers without which the current shortage of behavioral health providers would worsen. Medicaid provides access to essential outpatient opioid abuse treatments, such as medication assisted treatment and overdose reversal drugs.

- Medicaid funding is essential to delivering care in rural areas. Rural residents are more likely to be enrolled in Medicaid than urban residents for a variety of reasons: lower access to job-based coverage, greater prevalence of self-employed jobs, lower incomes, and a greater share of the population with a disability. Medicaid is also a critical source of income for rural hospitals.
